

Your First Week with Shop OS

OBSIDIAN BASICS, SEEDING, THE OPERATOR, THE OPTIMIZER

You finished the install and the onboarding interview. The vault is in Obsidian. Now what?

This guide covers the five things you need to know to start running your shop on Shop OS:

1. **How to use Obsidian to browse your vault.** 10 minutes. Read this first.
2. **How to feed your shop's existing materials into the vault.** Seeding. About an hour the first week.
3. **How to set up your daily morning briefing.** The `/bp-operator` skill. 5-10 minute setup, then automatic.
4. **How to keep the vault healthy over time.** The `/bp-optimizer` skill. 15 minutes once a month.
5. **How to keep your skills current.** One command, a couple of times a year.

You can skip around, but section 1 is worth reading first if you've never used Obsidian.

§ 01

1. How to use Obsidian to browse your vault

Obsidian is the app you use to **read, browse, and edit** your Shop OS vault. Think of it like Finder + Notes + a wiki rolled into one window. Claude Code does the AI work; Obsidian is where you actually look at the results.

You don't need to learn most of Obsidian's features. The basics get you 95% of the way there.

The window layout

When you first open your Shop OS vault in Obsidian, you'll see three areas:

Left sidebar	Main pane
(file explorer)	(whatever note you're reading)
- CLAUDE.md - Context/ - organization.md - Projects/ - Acme Cabinets/ - Henderson/ - Raw/ - Team/	# Shop OS Vault Welcome to your Shop OS vault. This is the operating system Blueprint IT installed for [your shop]...

- **Left sidebar:** a tree of every folder and file in your vault. Click any file to open it in the main pane.
- **Main pane:** the note you're currently reading. By default it's read-only; double-click anywhere to edit.
- **Right sidebar** (might be hidden): shows backlinks, outline, and other contextual info. Toggle with `Cmd+Shift+B` (Mac) or `Ctrl+Shift+B` (Windows). You can ignore this for now.

The 4 keyboard shortcuts you'll actually use

SHORTCUT (MAC / WINDOWS)	WHAT IT DOES
<code>Cmd+O</code> / <code>Ctrl+O</code>	Quick-open any file. Type a few letters of the filename, hit Enter.
<code>Cmd+Shift+F</code> / <code>Ctrl+Shift+F</code>	Search across every note in the vault.
<code>Cmd+,</code> / <code>Ctrl+,</code>	Settings (you rarely need this).
<code>Cmd+G</code> / <code>Ctrl+G</code>	Open the graph view. Visualizes your vault as a network of connected notes. Fun to look at; not essential.

Wikilinks: the magic of Obsidian

Throughout your vault, you'll see text in `[[double brackets]]`. These are **wikilinks**. Click any wikilink to jump to that note. If the note doesn't exist yet, clicking creates it.

Example: if a note about a customer mentions `[[Hooker Furnishings]]`, clicking that link takes you to the Hooker Furnishings supplier note. From there, you can navigate to all the jobs that used Hooker products, or to the latest Hooker price list. Everything is connected.

You don't need to type wikilinks yourself. Claude Code does that for you when it writes notes.

How to add a new note manually (if you ever want to)

Three ways:

1. **Right-click** any folder in the left sidebar → "New note" → type the name → start typing
2. **Cmd+N / Ctrl+N** creates a new note in the current folder
3. **Type a wikilink** like `[[New customer name]]` in any existing note, click it, and Obsidian creates the note for you

But honestly, the better workflow is: tell Claude Code what you want to add, and Claude writes the note. Example: "Add a note in Projects/Acme/ that the customer called today to push delivery to next Friday." Claude creates and saves it. You see it appear in the Obsidian sidebar in real time.

What to do if Obsidian feels overwhelming

Two things:

1. **Don't install any community plugins.** Shop OS doesn't need them and they can complicate things. The default Obsidian install has everything you need.
2. **Don't sign up for Obsidian Sync.** Your vault lives on your computer (and in Dropbox if you put it there). Obsidian Sync is a paid subscription you don't need.

Obsidian is just a viewer. You can always edit the same files in TextEdit, Notepad, VSCode, or any other text editor if Obsidian ever feels like too much. The vault is just a folder of plain markdown files.

Pro move: keep Obsidian open while you work

Open Obsidian to the vault first thing each morning. Read your operator's morning briefing (we'll set that up in section 3). Throughout the day, glance at it whenever you need to look something up: a supplier price, a customer's past job, your own notes from last week.

When you need to ADD or CHANGE something, that's when you switch over to Claude Code (also in the vault folder) and tell it what you want. Claude writes the note, Obsidian shows you the result.

2. Seed your vault with what you already have

Right now your vault knows what you told it during the onboarding interview. That's a great start, but the real power kicks in once it knows the things your shop has been collecting for years: supplier price lists, contract templates, customer history, job photos, phone-call notes.

You don't need to manually copy and paste any of this. You drop the source files into the vault, ask Claude Code to read them, and it writes structured notes for you.

Where to put materials: one folder, flat, no decisions

Open Finder (Mac) or File Explorer (Windows) and navigate to your Shop OS Vault folder. You'll see a folder called **Raw/** that the installer created for you. **That's your inbox.** Drop any file there. Claude Code reads it, decides where it belongs, files it correctly, and moves the original to **Raw/processed/** so the inbox stays clean.

```
Shop OS Vault/
├─ Raw/                ← drop everything here, flat. No subfolders to make.
│   └─ README.md
│   └─ processed/      ← Claude moves digested originals here automatically
├─ Context/            (your shop info, created by onboarding)
├─ Projects/           (one folder per job)
├─ Team/               (your staff)
├─ Resources/          (reusable templates and references)
└─ CLAUDE.md           (do not edit; Claude Code uses this)
```

Do not create subfolders inside **Raw/.** That's AI's job. Pre-sorting defeats the whole point of having Claude Code do classification. Just drop and go.

What kinds of files work

Anything readable. Claude Code handles:

- **PDFs** (contracts, price lists, invoices; text-based PDFs convert natively; image-only scans are flagged for manual review)
- **Excel spreadsheets** (.xlsx) and **Word docs** (.docx), converted natively with no extra software needed
- **Images** (photos, sketches, screenshots)

- **Audio recordings** (phone calls, voice memos; gets transcribed first via the `audio-transcriber` skill)
- **Plain text, CSV, and Markdown**
- **Web pages saved as PDF** (right-click → "Save as PDF" works in most browsers)

What Claude does with each type

YOU DROP	CLAUDE FIGURES OUT IT'S A...	AND FILES IT AS
<code>acme-vanity-contract.pdf</code>	Customer contract	New <code>Projects/Acme Vanity/</code> folder with contract terms, milestones, dates
<code>hooker-march-pricing.pdf</code>	Supplier price list	<code>Resources/pricing/hooker-2026-03.md</code>
<code>henderson-kitchen-finished.jpg</code>	Job photo	<code>Projects/Henderson Kitchen/photos/</code> with style + material tags
<code>2026-05-23-smith-call.m4a</code>	Customer phone call	Transcribed, summarized into <code>Projects/Smith/calls/2026-05-23.md</code>
<code>cabinet-finishing-sop.docx</code>	Internal SOP	<code>Resources/sops/cabinet-finishing.md</code>

You don't need to memorize this table. Just drop files in `Raw/` and let Claude decide.

How to actually trigger the digest

After you have dropped some files in `Raw/` , open Claude Code in your vault folder. Type the slash command:

```
/bp-digest
```

That's it. One command, easy to remember. It runs the full workflow: reads every file in `Raw/` , classifies each one, writes a structured note in the right vault folder, moves the original to `Raw/processed/` , and gives you a report like:

Processed 4 files:

- acme-vanity-contract.pdf -> Projects/Acme Vanity/contract.md
- hooker-march-pricing.pdf -> Resources/pricing/hooker-2026-03.md
- henderson-kitchen-finished.jpg -> Projects/Henderson Kitchen/photos/
- unknown.txt -> could not classify, left in Raw/

You skim the report, approve. If something landed in the wrong spot, tell Claude "move the [filename] note into [correct folder]". It learns the pattern for next time.

How much should I seed?

Start with the things you reference weekly:

- Your 3-5 most-used supplier price lists
- Your current open jobs (contract + scope + photos)
- The last 3 months of completed jobs (photos + final price)
- Your shop's standard contract template
- Any SOPs or training docs you have

That gives Claude Code enough context to be useful for daily questions. You can always add more later.

§ 03

3. Set up your daily morning briefing with /bp-operator

The operator is the autonomous part of Shop OS. You set it up once. After that, it runs on a schedule and writes a fresh briefing to your `Daily/` folder every morning before you walk into the shop.

A typical morning briefing for a cabinet shop:

Monday 2026-05-25

Today on the floor: Aviemore kitchen install (Greg + Pete), Henderson vanity finish (Marco)

Shipping today: Patel DIY Closet pickup at 2pm

Open follow-ups: Smith needs quote revision by Wednesday, Sherwood has not responded since Friday

Material orders arriving: Hooker shipment expected Tuesday AM

This week's deadlines: Bevel cabinet drawer-front prototype (due Thursday)

You read this with your coffee and know what your day looks like before you set foot in the shop.

Setup

In Claude Code, type:

/bp-operator

The skill asks you a few questions:

QUESTION	RECOMMENDED ANSWER FOR A CABINET SHOP
What cadence?	Daily, 7:00am (so it's ready when you arrive)
Where should the briefing land?	Daily/ (a new dated file gets created in this folder each morning)
Who should the briefing address?	You (your name from onboarding)
What sections to include?	Today on the floor, Shipping, Open follow-ups, Material orders, This week's deadlines

The operator wires itself up automatically. From now on, every morning at 7am, it reads your vault state and writes the briefing to your Daily/ folder.

When to NOT run the operator

It costs Claude subscription usage each run. If you take a vacation or close the shop for a week, you can pause it. In Claude Code, type:

```
Pause the operator until [date]
```

When you come back:

```
Resume the operator
```

How to change what's in the briefing

Just edit `Context/operator.md` in your vault and tell Claude Code what you want different. Example:

```
In Context/operator.md, add "Cash position" as a section to the morning briefing, and remove "Material orders arriving."
```

The next morning's briefing reflects the change.

§ 04

4. Keep the vault healthy with `/bp-optimizer`

Over time your vault accumulates clutter: stale notes from finished jobs, dead links to files you moved, half-written drafts you never finished. The optimizer cleans this up.

It is not a daily tool. Run it **once a week**.

What it does

In Claude Code, type:

```
/bp-optimizer
```

The optimizer scans every note in your vault against seven quality frameworks:

FRAMEWORK	WHAT IT CATCHES	EXAMPLE
Karpathy LLM Wiki	Broken links, orphaned notes, missing cross-references	A note that mentions "Henderson" but doesn't link to the customer's project
Anthropic CLAUDE.md	Schema doc completeness	Your CLAUDE.md is missing a section that confuses Claude
Caveman compression	Bloated instruction docs	Your operator prompt is 4000 words when it could be 800
Chroma context rot	Stale content that contradicts newer notes	An old supplier note that conflicts with this month's price list
Memory hygiene	Notes that should be archived	Job from 2024 still cluttering active project list
Progressive disclosure	Skills that load too much at once	(mostly relevant for the OS itself)
General hygiene	Inconsistent naming, missing frontmatter	Files named with mixed case conventions

§ 05

5. Keep your skills current

Blueprint IT ships improvements to the Shop OS skills regularly. Your skills do not update automatically. Run this command in Terminal a couple of times a year (or any time Blueprint IT tells you there is an update):

```
npx -y --package=@blueprintit/shop-os-install shop-os-update
```

You can run it from anywhere. It takes under a minute and does not touch your vault, license, or settings. Restart Claude Code after it finishes.

6. Let your team use the vault through Shop OS Chat

By now, the vault knows a lot about your shop. The next step is letting your team get to that knowledge without pinging you every time. That's what **Shop OS Chat** is for: a simple chat window that anyone in the shop can use to ask vault questions, on the shop computer, without touching Claude Code.

Two ways to talk to the vault

Shop OS gives you two interfaces, each pointed at a different audience:

- **Shop OS Chat** is the read-only browser chat. It's for **employees**, anyone in the shop who needs an answer from the vault but should not be editing files, scheduling routines, or running maintenance skills. They double-click the launcher, ask in plain language, and get answers grounded in your business data. Nothing they do can change the vault.
- **Claude Code** is the full-access terminal interface. It's for **you and any designated operators**, the people who run digests, schedule the morning briefing, optimize the vault, edit `Context/`, and trigger the write-side skills (`/bp-digest` , `/bp-operator` , `/bp-optimizer`). Full read, write, and execute against the vault.

Same vault, same context, two doors. The team gets the safe door. You and your trusted operators get the master key.

What it is

Inside your vault folder, next to `CLAUDE.md` and `Raw/`, the installer dropped two launcher files:

- `Shop OS Chat.command` (Mac)
- `Shop OS Chat.bat` (Windows)

Either one starts the chat. Anyone on the shop computer can double-click it.

How to launch it (first time)

1. Double-click `Shop OS Chat.command` or `Shop OS Chat.bat`.
2. A small terminal window opens. That's normal. It's the chat server running locally on the shop computer.
3. The default browser opens to a `localhost` URL with the chat page.
4. The page asks for the person's name. They type it once; the browser remembers from then on and skips straight to the chat.

The very first launch takes 20 to 30 seconds while the chat downloads. Every launch after that is instant.

Tip: drag `Shop OS Chat.command` (or `.bat`) to the shop computer's desktop so anyone can hit it without digging through folders.

How the team uses it

Ask anything that lives in the vault. Examples for a cabinet shop:

- "What's the status of the Aviemore install?"
- "Pull up everything we've quoted Sherwood since January."
- "Who's our Hooker rep and what did the last shipment cost?"
- "Find the SOP for finishing painted maple."
- "Has anyone called us back about the Henderson punch list?"

The chat reads the vault, finds the relevant notes, and answers in plain language. Every conversation saves into a `Chats/` folder inside your vault when the person ends it (clicking "End conversation" or closing the tab). You can read those transcripts in Obsidian later, or ask Claude Code "what did Marco ask about the Smith job last week?"

What it can and cannot do

The chat is intentionally limited to **reading** your vault. It can:

- Answer questions about anything stored in the vault
- Search across every note
- Summarize files, projects, customers, or topics
- Quote relevant passages back to you with the source

It cannot:

- Create new notes
- Edit existing notes
- Delete anything
- Run skills like `/bp-digest`, `/bp-operator`, or `/bp-optimizer`

If a team member asks it to "add a note about today's call," it will politely decline and point them to ask you. This is on purpose. Your team gets fast answers with zero risk of accidentally changing customer records, supplier lists, or contracts. You stay the one with write access via Claude Code.

Make the `chats/` folder a weekly habit

Open `Chats/` in Obsidian once a week and skim what your team has been asking. It tells you:

- Which questions keep recurring (those answers belong in an SOP)
- Where your team's mental model is incomplete (training opportunity)
- Which jobs and customers are getting talked about most (signal for what to prioritize)

It's the cheapest customer-research / team-training feedback loop you'll ever have.

§ 07

What you now have

After the first week, your Shop OS vault should have:

- ☒ Your shop's foundational info (Context/, set up by onboarding)
- ☒ A pile of seeded materials in their proper folders (Resources/, Projects/, Team/)
- ☒ A daily briefing arriving at 7am each morning (operator scheduled)
- ☒ A clean weekly cadence for vault health (optimizer reminder set)
- ☒ Your team self-serving vault questions through Shop OS Chat
- ☒ The update command saved somewhere you can find it (`npx -y --package=@blueprintit/shop-os-install shop-os-update`)

From here, the more you use it, the smarter it gets. Drop your customer call notes into the vault as they happen. Drop new supplier docs in `Raw/` as they arrive. Ask Claude Code questions about your shop's history and it will have real answers.

§ 08

Teach your brain something new with `/grill-me`

Your Shop Brain was built from the onboarding interview. But your business changes. Pricing shifts. You add a new service. You start going after a different type of customer. When that happens, your brain should know.

`/grill-me` is a focused interview skill you can run anytime to teach your brain something it doesn't know yet, or go deeper on something the setup interview only scratched the surface of.

How it works

Open Claude Code in your vault and type:

```
/grill-me
```

Tell it what you want it to understand. Examples:

- "Grill me on our new closet organizer service until you understand it well enough to write about it."
- "I want to go deeper on our pricing. We changed our model and the brain still has the old version."
- "We're starting to go after general contractors instead of homeowners. Grill me on what that means for how we talk about the shop."

It asks one question at a time, saves everything as you go, and at the end writes the conclusions into the right place in your vault. By the end of the session, your brain has it.

When to use it

- Something changed in your business (new service, new pricing, new customer type)
- The onboarding interview moved on before you'd fully explained something
- You want to think something through out loud and have the brain capture it

You don't need to prepare anything. Just start talking.

§ 09

What's next (when you want more)

When you're ready to go further, ask about these add-ons:

ADD-ON	WHAT IT DOES	WHEN TO ASK ABOUT IT
Marketing Pack	40+ pre-wired marketing skills (copy, social, email, ads, CRO, launches)	When you want to grow your shop's online presence
SEO Pack	Get your shop ranking for "custom cabinets [your city]"	When you want more inbound leads
Sales Pack	CRM prospect mining, cold email, lead qualification	When you want to optimize handling leads

Reply to the welcome email to ask about pricing for any of these.

§ 10

Need help?

Reply to your welcome email. We will respond ASAP.
